Problem & background

Problem: Maven Marketing faces challenges in utilizing data from 2,240 customers, including unclear segmentation, limited insight into product trends, and inefficiencies in campaign and channel performance. By analysing this data, the goal is to improve customer targeting, optimize strategies, and enhance campaign ROI and engagement through data-driven insights and predictive analytics.

Background: Maven Marketing is leveraging customer data to optimize its marketing strategies. Their analytics team must analyze profiles, product preferences, and campaign outcomes to identify effective approaches for different customer segments.

Solution

To optimize Maven Marketing's campaigns and customer engagement, we propose a comprehensive approach that integrates data analysis, actionable insights, and collaboration across teams.

Data Analysis

- Perform an in-depth segmentation of customer data using demographic, behavioral, and purchase patterns to identify key groups.
- Analyze channel performance metrics (e.g., CTR, engagement rates) to determine the most impactful marketing platforms.
- Use data tables and statistical models in Excel or SQL to uncover product preferences and seasonal demand trends.

Data-Driven Insights

- Leverage data analysis results to craft personalized strategies for each customer segment.
- Optimize campaign content, timing, and offers based on historical success metrics.
- For example:
    1. If SMS campaigns yield higher conversions among younger demographics, prioritize this channel for that group.
    2. If specific products drive repeat purchases, design loyalty programs around them.

Stakeholder Engagement

- Create user-friendly dashboards that provide actionable insights for stakeholders, including marketers, product managers, and executives.

- Collaborate with the analytics team, campaign strategists, and sales teams to align on goals and refine approaches.
- Host regular workshops to share findings and gather input for continuous improvement.

Project scope

a) Campaign Optimization:
   - Leverage insights to design data-backed campaigns with clear KPIs.
   - Continuously refine campaigns through A/B testing and performance analysis.

b) Channel Strategy:
   - Allocate resources to the most effective marketing channels.
   - Test emerging platforms and channels for potential expansion.

c) Customer Experience:
   - Develop personalized communication strategies for each segment to improve engagement.
   - Tailor offers and promotions to meet the unique needs of different groups.

Methodology

a) Data Resources:
   - Maven Marketing supplies customer data in Excel spreadsheets, including customer profiles, product preferences, campaign outcomes, and channel performance metrics.

b) Data Wrangling:
   - Clean and preprocess the data by addressing missing values, outliers, and inconsistencies.
   - Merge data from multiple tables into a single, well-structured Excel file.
   - Standardize formats for dates, numerical values, and categorical fields to ensure consistency.

c) Data Analysis:
   - Use Excel functions, pivot tables, and charts to explore patterns, correlations, and trends.
   - Segment customers by demographics, behavior, and purchasing habits.
   - Analyze campaign outcomes and channel performance metrics to identify key drivers of success and areas for improvement.

d) Data Visualization:

- Develop an interactive and user-friendly dashboard using Power BI or Excel.
- Display key insights such as customer segmentation, product trends, campaign ROI, and channel effectiveness.
- Ensure the dashboard provides actionable information to guide decision-making and strategy development.

Goals

- Customer demographics and behavior influence purchasing decisions and campaign responsiveness.
- Distinct preferences exist for products and channels across different customer segments.
- Campaign performance metrics and channel effectiveness determine the most impactful marketing strategies.

Technical processes

- Formula used: Functions like COUNT, AVERAGE, SUMIF, VLOOKUP, Pivot Tables, MAX, MIN, and IF statements in Excel will be used to analyze customer profiles, product preferences, and campaign outcomes. Graphs, charts, and conditional formatting will help visualize trends and insights.
- Tools used: Excel for data cleaning, merging datasets, performing statistical analysis, and creating pivot tables and visualizations. Power BI may be used to develop more interactive dashboards for enhanced insights and reporting.

Recommended analysis

Questionnaire

1. Are there any null values or outliers? How will you handle them?

    - 24 missing values were found in the "Income" column. To fix this, these missing values were replaced with 0.
    - Also, to deal with outliers, a special statistical method called the Z-score method was used.
    - Values that were too different from the rest (absolute Z-score > 3) were identified and replaced with the average "Income" value. This cleaning process makes the data more accurate and reliable for further analysis.

2. What factors are significantly related to the number of web purchases?

   - We can see that Year-Birth, Income, Education and Country are significant factors in web purchase.

3. Which marketing campaign was the most successful?

   - Campaign-4 is the most successful based on the highest number of responses (167 responses).
   - However, the Last Campaign generated the most responses overall (334 responses).
   - Suggesting it may have been particularly effective or recent in terms of engagement.

4. What does the average customer look like?

   - The average customer is 42-61 years old, born between 1963 and 1982, reflecting a mature demographic.
   - The average customer likely holds at least a college degree, with many having a master's or PhD, indicating a highly educated customer base.
   - Most customers are married or living with a partner, indicating a settled, family-oriented group.
   - The typical customer earns between $30,000 and $60,000 annually, in the middle-income range**.**
   - The average customer is primarily from Spain, with notable groups in Saudi Arabia and Canada., reflecting an international customer base.

5. Which products are performing best?

   - Wines and Meat are the best-performing products based on customer spending
   - While Fruits and Sweets see the lowest average expenditures.

6. Which channels are underperforming?

   - The Catalogue channel is underperforming compared to the Web and Store channels, which have significantly higher purchase totals.

Conclusion

The provided dataset is a valuable resource for analyzing customer behavior, product preferences, and the effectiveness of marketing campaigns across various demographics. By examining factors such as age, gender, purchase history, and channel responsiveness, Maven Marketing can gain insights into how different customer segments engage with campaigns and respond to products. This data can be used to explore key questions around customer segmentation, product demand, and channel optimization. Depending on the objectives of the analysis, tools like Excel, Power BI, and advanced data analytics techniques may be employed. The insights from the data will help Maven Marketing personalize campaigns, optimize marketing strategies, and improve customer engagement, ultimately driving better ROI and stronger brand loyalty.
